

Creating driver objects/ creating the various browser sessions using selenium 4

Selenium 4 installs the drivers of current version of your browsers automatically so there is no need to download driver executables

```
from selenium import webdriver
```

```
driver = webdriver.Chrome()  
driver.get("http://demowebshop.tricentis.com/")
```

As the session is closed automatically after using the above code we can use the ChromeOptions class or adding additional capabilities to the driver object as shown below.

```
from selenium import webdriver
```

```
options = webdriver.ChromeOptions()  
options.add_experimental_option("detach", True)  
driver = webdriver.Chrome(options=options)  
driver.get("http://demowebshop.tricentis.com/")
```

creating an instance of Firefox class

```
from selenium import webdriver  
driver = webdriver.Firefox()
```

For firefox there is no need to add any options as the browser does not close automatically as in Chrome
