

"""locating elements and using webelement methods"""

```
import time
```

```
from selenium import webdriver
```

```
opts = webdriver.ChromeOptions()
```

```
opts.add_experimental_option("detach", True)
```

```
driver = webdriver.Chrome(options=opts)
```

```
driver.get("https://demowebshop.tricentis.com/")
```

```
driver.maximize_window()
```

find_element() --> locating any web element in the web page --> webelement object

locating element using id locator

```
search_bar = driver.find_element("id", "small-searchterms")
```

```
search_bar.click()
```

```
search_bar.send_keys("books")
```

```
time.sleep(2)
```

```
search_bar.clear()
```

```
print(search_bar.is_enabled())    # True
```

```
print(search_bar.is_displayed())  # True
```

locating search button using class locator

```
button = driver.find_element("class name", "button-1.search-box-button")
```

```
print(button)    # webelement object of search bar
```

```
button.click()
```

locating element using name locator

```
search_bar = driver.find_element("name", "q")
```

```
print(search_bar)
```

```
search_bar.click()
```

```
search_bar.send_keys("books")
```

```
time.sleep(2)
```

```
search_bar.clear()
```

locating register using link text locator

```
register_link = driver.find_element("link text", "Register")  
register_link.click()
```

locating register using partial link text locator

```
register_link = driver.find_element("partial link text", "Reg")  
register_link.click()
```

```
driver.close()
```
