

CSS(Cascading Style Sheet) SELECTORS

- In CSS, selectors are used to target the HTML elements on our web pages that we want to style.
- It is a pattern of elements and other terms that tell the browser which HTML elements should be selected to have the CSS property values inside the rule applied to them.
- The element or elements which are selected by the selector are referred to as the subject of the selector.

Syntax:

tagname[attribute_name = "attribute_value"]

Advantages of css selectors

1. We can locate an element using any attribute irrespective of id, classname, name, link text or partial link text.
2. We can traverse from parent to child element.
i.e., parent_element > child_element

Drawbacks of css selector

1. If the attributes are not present, then it is difficult to write css selector expression
2. CSS selector does not have text(). (no elements can be located using it's text in css selector)
3. Indexing is not supported in css selector.
4. We cannot do backward traversing in css selectors. i.e., from child to parent

```
import time
```

```
from selenium import webdriver
```

```
opts = webdriver.ChromeOptions()
```

```
opts.add_experimental_option("detach", True)
```

```
driver = webdriver.Chrome(options=opts)
```

```
driver.get("https://demo.actitime.com/login.do")
```

```
driver.maximize_window()
```

```
# locate username
```

```
driver.find_element_by_css_selector('input[placeholder="Username"]').send_keys("admin")
```

```
# locate password
```

```
driver.find_element_by_css_selector('input[name="pwd"]').send_keys("manager")
```

```
# locate login button
```

```
driver.find_element_by_css_selector('a[id="loginButton"] > div').click()
```
